TOPIC – POWERSHELL

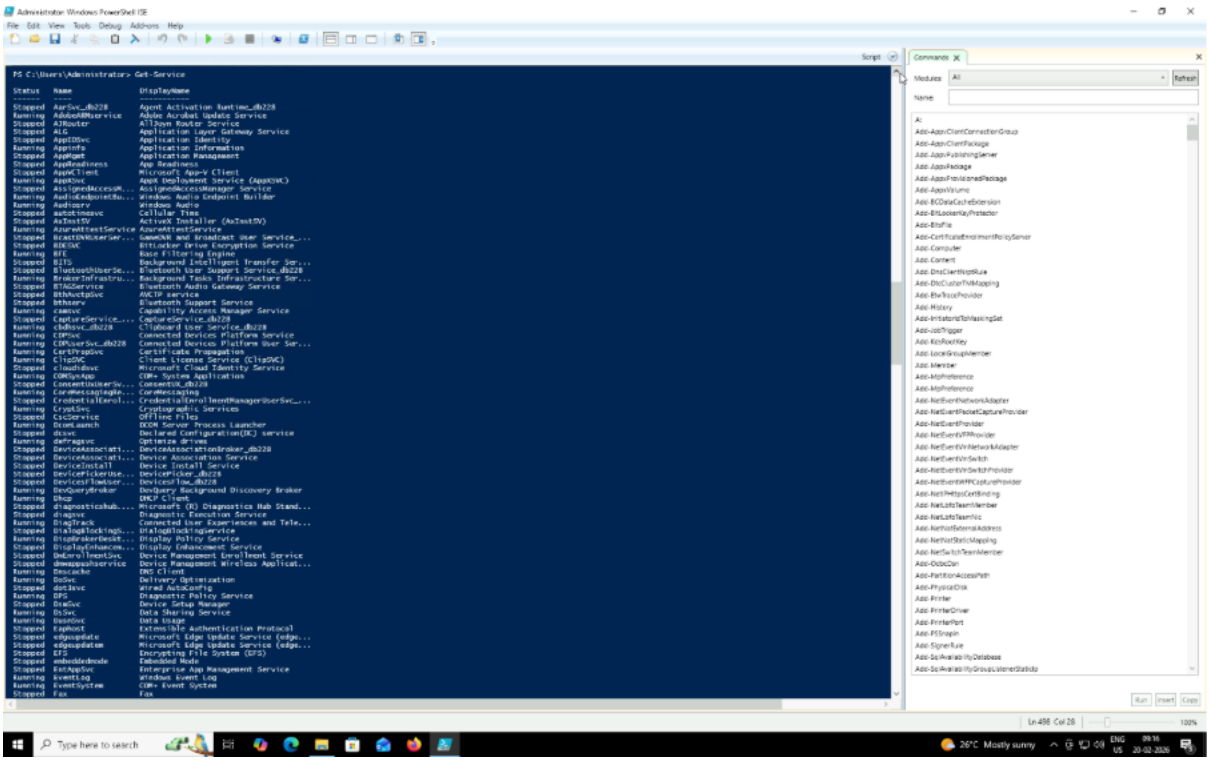

Assignment 1: Cmdlets and Pipelines Exercises

As part of this assignment, you need to complete below tasks:

1. Use basic cmdlets like Get-Process, Get-Service
2. Practice piping commands: Get-Process | Where-Object {$_.CPU -gt 10}
3. Create custom aliases for frequently used commands
4. Explore system and user-defined aliases

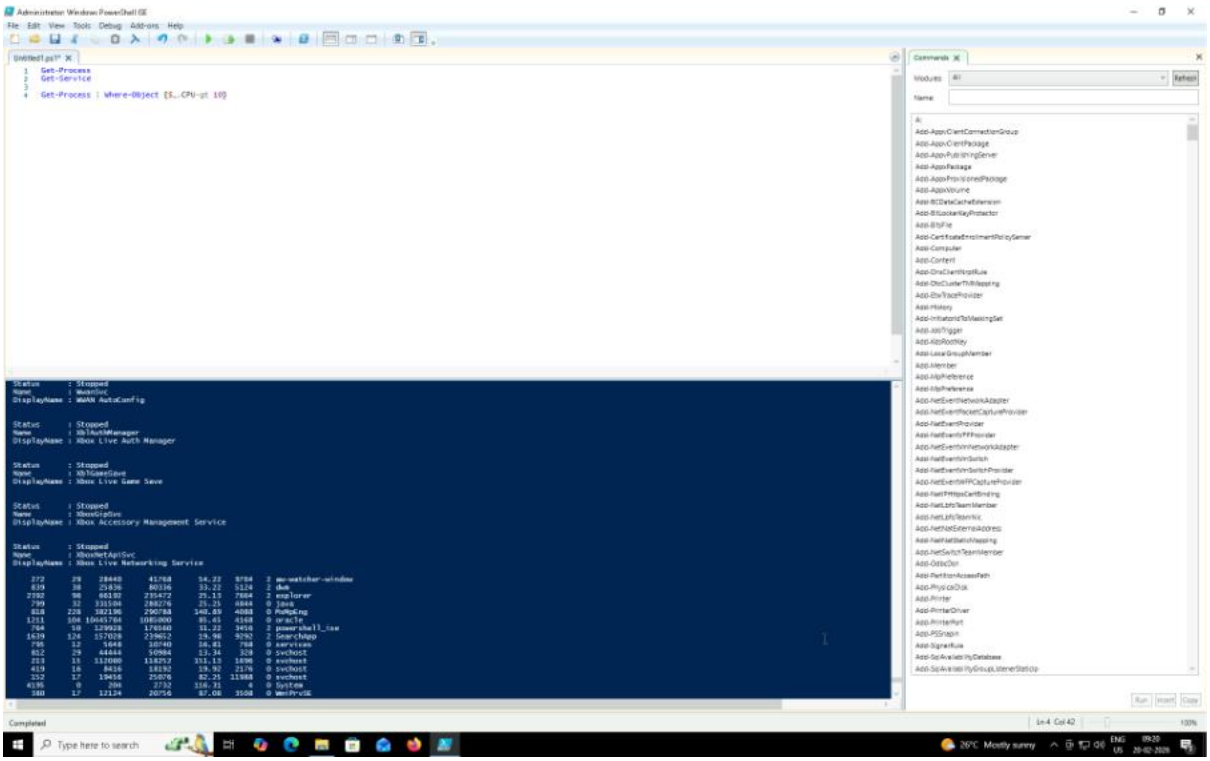

Shows all running processes.

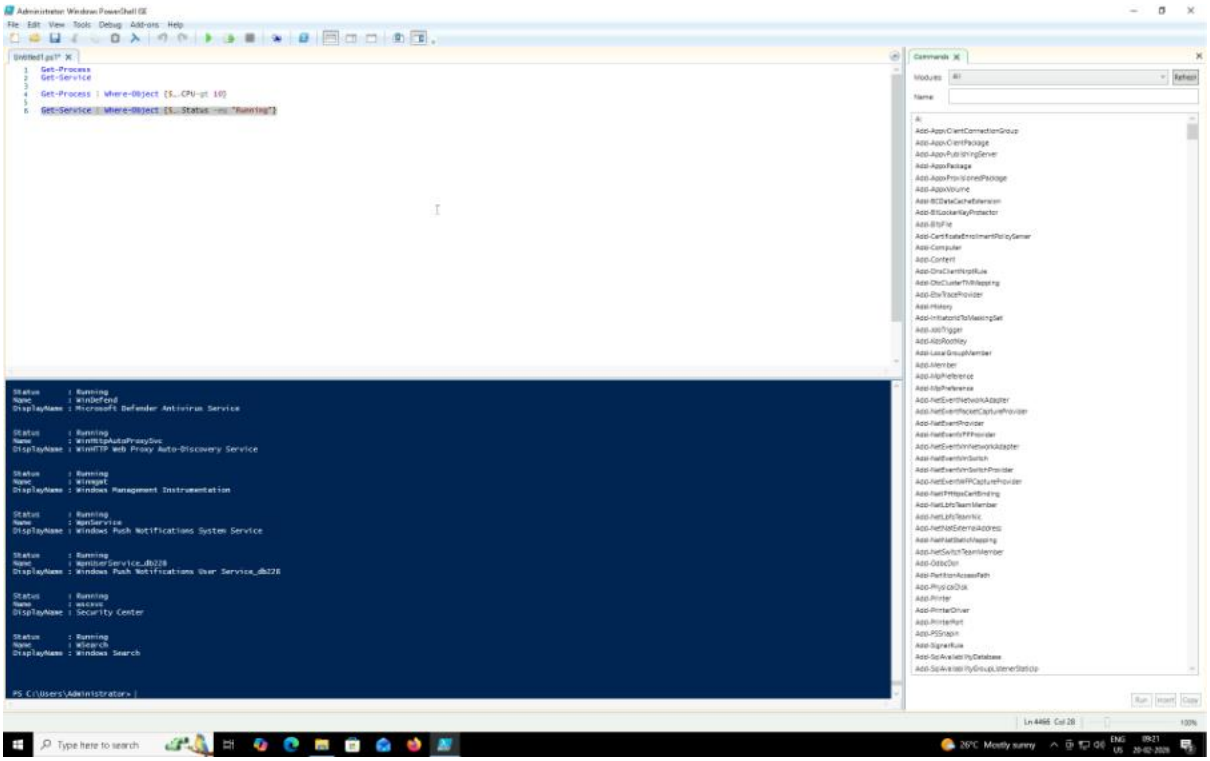

Show all Windows Services.

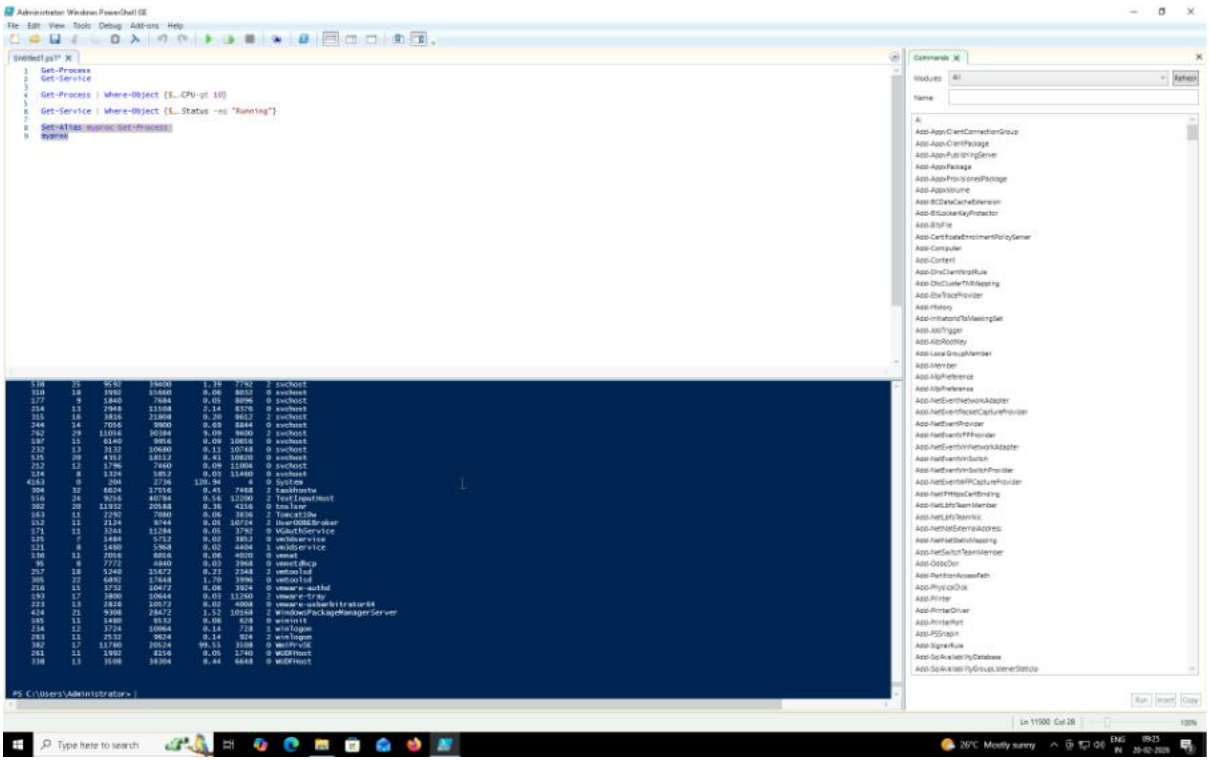

Basic PowerShell cmdlets **Get-Process** and **Get-Service** were executed to retrieve information about running processes and system services. Theses commands demonstrate PowerShell’s ability to interact with the operating system.

Shows only processes consuming CPU for less than 10 Seconds.

PowerShell pipeline was used to pass output from one cmdlet to another. **Where-object** filtered processes based on CPU usage and services based on running state.

The system displayed the running process list successfully.

System-defined and user-defined aliases were explored using **Get-Alias.** This helps understand how PowerShell maps short commands to actual cmdlets.

Assignment 2: Convert system information to different formats

As part of this assignment, you need to complete below tasks:

1. Export process list to CSV: Get-Process | Export-Csv processes.csv
2. Convert CSV to JSON
3. Read and manipulate text files using PowerShell cmdlets

Process information would have been exported into a CSV file using **Export-Csv**. This demonstrates the PowerShell's capability for report generation and data sharing.

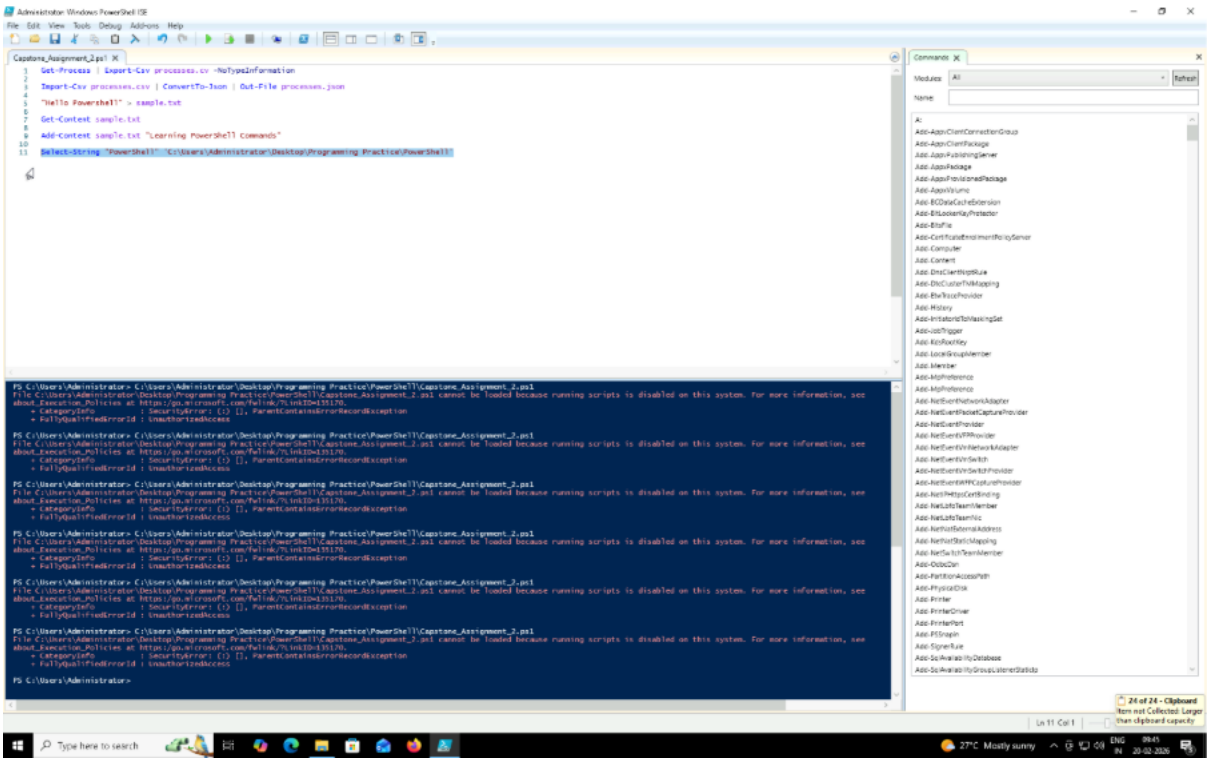

We have not been given access to run scripts hence we couldn't get the desired output.

The created CSV file would have been converted into JSON format using **ConvertTo-JSON**. This allows compatibility with web application and APIs.

This would have created a sample.txt file with the content "Hello PowerShell".

This would have helped you read the file.

PowerShell cmdlets **Get-Content** and **Add-Content** were used to read and modify the text files. This demonstrates file handling capabilities of PowerShell.

This command helps you search for strings in the document.
